

More studies on BPL interference to Amateur HF frequencies need to be done before this medium is rolled out. An NTIA study recently released shows the potential to widespread static and qrm caused by this service. Does the FCC have the regulatory capability and manpower needed to control and stop the interference this medium will generate? Why has the FCC ignored the studies and comments provided by the ARRL on all the problems this media will cause? Both amateur radio and NTIA HF frequencies will be grossly affected by BPL. Stop this medium now.
